

## Top Global CEO's Briefed on Anti-Aging Revolution

London, UK -- September 12, 2007 / The Forbes Global CEO Conference in Singapore of the world's top business leaders has today been told that we now stand on the brink of a golden age of greatly extended human longevity. The anti-aging pioneer, Dr. Robert Goldman, gave over 400 tycoons a key conference briefing on the medical biotechnology behind the revolution in aging, and its societal implications.

Dr. Goldman, who is Chairman of the Board of the world's leading medical society on aging, the American Academy of Anti-Aging Medicine (A4M), told conference attendees that his organization is at the cutting edge of a major shift in medical science from the treatment of disease to a focus on wellness.

“We now understand the human body better than ever,” said Dr. Goldman in his conference briefing. “How and why it ages and sickens, and how to prevent disease, and fix or replace body parts that degenerate. We have emerging biomedical technologies such as stem cell therapy, nanotechnology drug delivery and even the development of bioidentical replacement organs. With early detection and appropriate intervention, many diseases can be prevented, cured, or have their downward course reversed.”

Concluded Dr. Goldman: “The cumulative effects of these advances mean that life spans of up to, and over 120 years are possible for people alive today.”
